

AQUAPRO v.s. BFS

The float lengths available from AQUAPRO and BFS are almost the same. The table above shows all 8 float lengths of each brand (left AQUAPRO right BFS). The number below the AQUAPRO float (eg. -2mm) indicates how many millimeters the AQUAPRO float is shorter or longer than the BFS float. FYI: The float number on AQUAPRO stands for the length from the collar of a 35mm push-in fill plug to the bottom of the float. The float number on BFS stands for the actual length of the float itself.

Note: both systems require a clearance between the bottom of the float and the battery plates (or moss shield) of at least 5mm.
